

Adult Guide - E01 Something Is Here

Review version 1.3.0 Author: Maria Smith Audience: parents, carers, early-years practitioners and teachers Final-publication status: awaiting Maria Smith's approval

Purpose of the new game-story edition

The child joins Mira and Pip in one continuous mystery. A parcel arrives on page 3 with a map and the instruction FIND NOTHING TO OPEN THE STAR DOOR. The map visibly begins with five empty star spaces. The practice search does not earn a star; the empty box, still bell, blank card, visible word and partly hidden toys then earn Stars One to Five in that order. Only after all five have been checked does the Star Door open and reveal the two-door investigation. The result therefore resolves the question introduced by the parcel instead of appearing as an unrelated statement near the end.

Each challenge page lets the child look, listen, choose, point or communicate before the following page reveals and discusses possible answers. The story delays its general rule until the child has experienced empty, quiet, blank, hidden and unrepresented cases.

Version 1.3.0 keeps the familiar OpenMoji pictures and changes the reading order: story words and prompts now appear above the illustration. Challenge pages show recognisable objects without answer names; the next page repeats the scene with each label above its object. The same emoji vocabulary appears in the companion digital adventure.

The six reading codes are no longer printed in large banners. Each reveal hides its code within a story object. Finding one is an optional picture hunt. The accessible description states the code and its location so the game remains available to a learner who cannot search visually.

The child book deliberately avoids the formal terms candidate grammar, counterexample, occurrence, operational boundary and direct forcing. Those exact terms belong here, where an adult can protect the scientific scope without making the child repeat unexplained language.

Narrative-coherence rule

Every new object, rule and reward must have a visible cause in the story:

1. the parcel introduces the mystery;
2. the five empty spaces establish the number of investigations;
3. the practice search teaches the play rhythm without quietly awarding a star;
4. each numbered clue changes exactly one empty space into a lit star;
5. five lit stars cause the Star Door to open;
6. the two doors supply the complete final check; and
7. the completed map is filed in the workshop library before the next parcel

previews Book E02.

When sharing the book, briefly point back to the map whenever a star lights. If the child loses the thread, use: “The parcel asked a question. We are checking five clues so the door will let us test it.” Do not introduce a reward or scientific term before the story has shown why it is present.

Vocabulary rule

A learning word is not used as though its meaning were already known. The child first sees or performs the distinction, then receives the short word and a plain explanation. The next relevant page repeats it. The companion game adds a visible word helper for every level. Ordinary conversation should still replace any word the child does not understand; completing a vocabulary test is not a condition of participating in the story.

Exact SFT source

Claim: SFT-ROOT-THERE-IS-NO-NOTHING Status: independently replicated Provenance: direct forcing Closure: depth-independent within the declared operational boundary Receipt: sha256: 711864171e4d3a2f2734f0c2890965bcd81a0228349538751a3c80699c27d669

Exact statement:

No admissible operational statement, denial, record, proof object or
derivational object is nothing: absence presents no counterexample, while
every presented counterexample is an occurrence.

The complete declared grammar has two named classes:

1. Unpresented absence supplies no statement, denial, record, trace or

identity, so it supplies no operational counterexample.

1. Presented occurrence supplies a statement, denial, record, trace or

identity; that presentation is an occurrence and is not nothing.

The theorem does not claim knowledge of an unexpressed metaphysical domain. The book's game, characters and visible examples are educational translations; they do not prove a new theorem or replace the admitted claim package.

Learning through experience

After repeated shared play, a child may begin to:

- notice several things in a detailed scene;
- distinguish a present container from a named item that is not inside it;
- distinguish a missing sound or mark from the listening or page that remains;
- notice that hidden is not the same as erased;
- attempt a challenge before seeing a possible answer;
- sort presented examples from a case where no example is supplied;
- explain a choice by pointing, speaking, signing, drawing or using a

communication aid; and

- keep an unexpected answer rather than changing the game to force agreement.

These are invitations, not pass/fail expectations.

Child-facing vocabulary

- here - available in the game for us to notice;
- inside - held within the named container;
- empty - the named content is not inside a container;
- still - the object did not move during the short check;
- blank - there is no mark on the card;
- hidden - blocked from the chosen view;
- clue - something noticed that helps us look again;
- check - look, listen or try again using the declared game; and
- observation - something the child notices during the agreed look, listen

or check;

- example - something shown or given for the players to look at or check.

Prefer those words in conversation. If a child asks about “occurrence” or “boundary,” explain them in ordinary language but do not require recall.

Before playing

The printed story is complete without extra materials. Optional demonstration materials are:

- one large, safe open box or bowl;
- one familiar large toy;
- a bell that an adult controls, or simply a pretend bell;
- sturdy paper and thick crayons; and
- a blanket or cloth used where the child can see and leave freely.

Avoid small parts, sealed containers, blindfolds and enforced silence. Never hide a person, essential comfort object or item the child may find distressing. The child may watch, point, sign, speak, move, draw or opt out.

How to use a challenge/reveal pair

1. Read the challenge page and pause.
2. Let the child scan the whole illustration before prompting.
3. Accept any clearly identified present detail, including one not in the

suggested answer.

1. Ask “What helped you decide?” rather than “Are you sure?”
2. Turn the page and compare with the reveal.
3. If the child's answer differs, keep it and inspect the picture together.

The reveal is a shared check, not a score screen. Several pages contain extra details so noticing beyond the printed target remains valuable.

Page-by-page story and answer guidance

Pages 3-4 - receive the parcel and learn the route

Name the parcel before reading its note. Let the child locate the map, the five empty star spaces and the closed Star Door. The note creates the story question; the map creates the order in which it will be investigated. Invite the child to trace the route and count the empty spaces by pointing, without turning this into a number lesson. Rehearse the game rhythm: "Look, say, turn, check." A non-speaking child may use gaze, gesture or a partner record.

Pages 5-6 - practice before Clue One

The challenge shows familiar emoji for Mira, Pip, bed, window, books, lamp, box and bell without labels. The reveal repeats the same arrangement and writes each name above its emoji. Any named pictured object is valid. The aim is to establish that the child can find more than the adult's printed list. Page 6 explicitly says that this is practice and that no map star has lit yet.

Hidden code: ROOMSTAR, printed on a small star sticker among the room objects.

Pages 7-9 - the empty box

Challenge first: "Did she find nothing?" Do not correct immediately.

Reveal: the named toy is outside the box. The box and toy remain visible, and Mira looks inside. Page 9 explains in ordinary speech that a container holds things and that empty means the named toy is not inside it.

Optional demonstration: show the large toy, place it in the box, remove it and ask what changed and what stayed. Keep both records.

Hidden code on page 9: BOXCLUE, on the clue-star picture.

Pages 10-11 - the still bell

Allow a brief listening pause. Expected observations include Mira listening, Pip waiting and the bell staying still. "No ring" is bounded to that short declared moment. If a real sound interrupts an optional demonstration, record it rather than replaying solely to obtain the desired answer.

Do not describe silence as a substance and do not ask the child to remain still.

Hidden code: QUIETWINGS, printed on the bell.

Pages 12-13 - the blank card

The four intended clues are the card, pencil, Pip's feather and Mira's magnifying glass. Other page features may also be noticed. The reveal separates "no mark on the card" from "no card presented."

Hidden code: BLANKEDGE, along the card edge.

Pages 14-15 - the hidden word

The letters N-O-T-H-I-N-G appear across seven blocks. A child may find some letters, the whole word, other shapes or the enclosing outline. The reveal shows that a written label is itself a presented record. It is not automatically the thing it names.

Pages 16-17 - behind the curtain

Part of each toy is hidden from the chosen view while a recognisable part stays visible. The child can still see the curtain, toy parts, Mira and Pip. Avoid generalising this to objects that are unobserved by every route; the activity concerns one partly blocked view in the scene.

Hidden code: CURTAINMAP, woven into the curtain picture.

Pages 18-21 - the Star Door and two-door game

Page 18 pays off the map established on page 4: all five spaces are now lit, so the Star Door opens. The two smaller doors are behind it and were not available before the five investigations. Page 19 is the setup. Door A holds out a card while Door B does not. The child is first asked which door gives Mira something to look at. Only then does the book explain that an example means something shown for us to look at or check.

Page 20 checks Door A: the door shows the card to Mira, so the offered example is an occurrence rather than nothing.

Page 21 checks Door B in concrete language first: no card was shown, so Mira has no object from that door to look at yet. The short phrase no example was given is introduced only after that experience. It does not mean that a secret object was observed; the book must not pretend one was supplied.

These two doors are the child-facing translation of the complete two-class candidate grammar. The picture game does not replace its formal census.

The final hidden code is TWODOORS, placed on the treasure ribbon on page 25.

Pages 22-23 - try to draw nothing

Both choices are allowed. If the child draws, the mark and action are presented. If the child makes no mark, the card and the choice remain presented. Do not call a blank page numerical zero.

Pages 24-25 - infer, name and resolve the parcel

Only after all challenges does Mira state the detective rule. Ask the child to retell one earlier clue that supports it. Page 25 then names the root theorem: “There is no nothing,” and explicitly connects the result to the parcel’s note. The adult should retain the operational boundary in the exact-source section above.

Page 26 - fair-play boundary

The game mat marks what can be shown, said, drawn or recorded. Beyond the rope, the illustration adds no invented object and makes no claim. A useful adult sentence is: “We say what our check can reach, and we do not pretend it reaches farther.”

Pages 27-28 - final spot scene

The four intended pairs are:

- box here - no toy inside;
- bell here - no ring during the scene;
- card here - no mark on the card; and
- curtain here - toy partly hidden from the chosen view.

Mira, Pip and decorative shapes are valid extra present details.

Pages 29-30 - sorting game

Place the empty box, still bell and blank card under “object to look at.” Each is a shown object with a declared missing content, event or mark. Place only the dashed empty frame under the NO OBJECT SHOWN YET heading. Page 30 then links this plain description to the short phrase no example given. The second basket does not contain a hidden thing; it records that no object was shown for the players to inspect.

Pages 31-32 - file the case and continue

The certificate records participation, not attainment. Invite the child to choose one clue to retell. Mira files the completed five-star map in the workshop library so the story visibly closes. A new parcel then previews E02 by asking how one whole can have many parts; it does not yet teach the next theorem.

Common misconceptions and gentle responses

“An empty box is nothing.”

“The toy is not inside. What can you point to that is still here?”

“Nothing happened when the bell did not ring.”

“You noticed no ring. What did you do while you checked?”

“If I cannot see it, it is nothing.”

“In this picture the curtain blocks one view. What else can we still see?”

“The word NOTHING is nothing.”

“Can you point to the letters? Then the written word is something we can check.”

“Door B proves a secret nothing is behind it.”

“Door B did not give us an example. We do not add a secret one.”

“The theorem tells us everything about what nobody could ever express.”

It does not. The admitted claim concerns operational statements, denials, records, proof objects and derivational objects. It claims no knowledge of an unexpressed metaphysical domain.

Observation notes

Use brief narrative notes only when useful. Possible observations include:

- scans a complex illustration and notices an unprompted detail;
- waits for the reveal after offering an answer;
- distinguishes container from named content;
- distinguishes no event from listening or waiting;
- explains that hidden depends on a selected view;
- accepts or investigates a different answer; and
- communicates through speech, sign, gaze, pointing, drawing or an aid.

Accessibility

- Read all text and illustration descriptions aloud when helpful.
- Offer real, large tactile versions of the box, card and cloth.
- Every target has a shape or text cue; colour is never the only cue.
- Let the child examine one area at a time or cover busy parts of a scene.
- Accept all communication routes and allow extra processing time.
- Use the semantic HTML edition for scalable text and page descriptions.
- The PDF contains selectable text but is not claimed as a fully tagged PDF.

Companion digital adventure

Level One is a complete original 3D story-puzzle adventure called The Star Door Mystery. It is not six disconnected quiz levels. Mira, Pip and six original travellers receive the same parcel, see the same five empty spaces, practise without earning a star, investigate the same five clue families and open the same final door. The map remains visible during play so the reason for every star and the location of the ending are never lost.

Every learning word is defined in the game after the relevant experience. The game contains the complete child-facing lesson and boundary explanation, while the book remains valuable for its slower challenge/reveal rhythm, labelled illustrations, shared discussion and hidden-code searches. The six codes unlock optional character moments only. They never gate an explanation, star, next scene or scientific result.

The intended loop is:

1. follow the current story event and try its visual puzzle;
2. keep the first try and compare it with the labelled check;
3. read or reread the exact named book pages;
4. optionally enter the hidden page code for extra character story; and
5. return to see the checked clue change the persistent map.

Replay moves some choices. After the two-door result, the map asks one later question about an earlier clue; a correct answer earns a memory spark but never changes the five-star route. No first try loses a star, and no timer or streak competes with reading.

The game collects no name, age, email, location, voice, image or analytics. Optional progress is stored only on the device and can be reset. There are no advertisements, purchases, public scores, chat, streaks or time pressure.

Reference-only curriculum navigation

The play can support attention, turn-taking, communication, early literacy, observation and expressive response. Those usability links are calibrated against Early Years practice. Curricula are not scientific dependencies and do not validate the theorem.

Scientific checks preserved in the adult edition

The admitted claim passed the complete two-class census, minimality, named-shape uniqueness, false-premise, tampered-source, tampered-artifact and boundary controls, plus implementation-distinct reconstruction. The story translates these habits into paired challenges, both two-door routes, a delayed reveal and a fair-play boundary.

No empirical claim is added. The box, bell, card, curtain and game characters are demonstrations of language and checking, not measurements proving the formal theorem.
