

Adult Guide — E02 *One Whole, Many Parts*

Review version 2.0.0 Author: Maria Smith Audience: parents, carers, early-years practitioners and teachers
Final-publication status: awaiting Maria Smith's approval

What this book teaches

Mia, Sol and Tavi open the parcel that arrived at the end of Book One. It contains one complete Moon Lantern and a simple request: bring it to the balcony. The way is blocked by a little door. The whole lantern is too wide, so the team must open it into four agreed parts, keep every part, carry each one through, and rebuild the same whole.

The child learns through that one visible problem. They first see the complete lantern. They then find its seams, count its four parts once each, compare sizes, identify a missing place, join two groups of two, and rebuild the whole. The words *whole*, *part*, *plus* and *equals* follow the experience instead of replacing it.

Pax is the only new guest in this book. Pax keeps pieces safe and asks questions, but does not supply an answer before the child has tried. Mia, Sol and Tavi remain the permanent team.

How to share the book

Read the story pages at an unhurried pace. On an activity page, read the short instruction, pause, and let the child point, trace, speak, sign, look or use a communication aid. Do not turn the page immediately. The next page or story beat checks the answer.

Helpful prompts include:

- “Show me what you notice.”
- “Have we touched this part already?”
- “Is any place still empty?”
- “Are these two picture cards the same size?”
- “What are we counting?”

Avoid prompts that disclose the answer, such as “Choose four” or “Put that piece in the bottom corner.” A different first answer is useful evidence. Keep it visible long enough to compare.

The visible cause chain

1. The parcel contains one complete Moon Lantern.
2. The whole lantern is too wide for the little door.
3. Pax shows two safe seams.
4. The seams open the lantern into four parts.
5. The child counts every part once.
6. Each part travels through the door.
7. The child checks size and a missing place.
8. Two parts plus two parts make four parts.
9. All four parts return to their matching places.
10. The same whole lantern shines on the balcony.

Activity answers and teaching prompts

1. Lantern Detective — page 8

Answer: the middle picture, labelled **SAME WHOLE**. It shows the same complete lantern. The first picture has a missing place. The third has an unrelated star added.

Say: “The whole means all of this lantern, with none of it missing and nothing extra added.”

2. Seam Hunt — page 11

The child traces one line down and one line across. The lines divide the lantern picture into four visible parts. Accept a guess before the reveal.

Say: “The seams show where the lantern can open. Now we can check how many parts appear.”

3. Count Keeper — page 14

The child follows the gold trail and touches each of the four quarter cards once: one, two, three, four. The important action is not merely reciting numbers; it is keeping one count for each visible part without skipping or repeating one.

Say: “You gave one number to each part. That made the count clear.”

4. Doorway Parade — page 17

The child traces four coloured paths through the open door. Every lantern-part card must have a route. The following page shows all four cards together on Pax’s tray.

Say: “Every part came through. No part stayed behind, and no new part was added.”

5. Same-Size Pairs — page 20

Answer: Pair A. Its two picture cards have matching outer sizes. Pair B contains one large and one small card. The picture compares visible size only; it does not claim that every object called a part must always be equal.

Say: “Pair A matches in size. Matching sizes help the parts return to matching places.”

6. The Missing Place — page 22

Answer: the first choice, the bottom-right lantern part. It completes the frame. The other lantern part belongs in a different position, and the star is not part of this lantern.

Say: “The last agreed part fills the empty place. There is no gap and no overlap.”

7. Add Together — page 25

Answer: 4. Mia carries two visible parts and Pax carries two visible parts. Read the next page aloud as “two parts plus two parts equals four parts.”

Say: “Plus joins the two groups. Equals tells us both sides count the same four visible parts.”

8. Lantern Builder — page 28

The child traces each quarter card to its matching place in the two-by-two frame. Each part is used once. The next page shows the same whole lantern rebuilt.

Say: “All four parts are back in their places. Four parts make one whole lantern.” Do not shorten this to “four equals one,” because *parts* and *whole lantern* name different things.

Exact SFT source boundary

The picture book is an age-appropriate educational translation of admitted Smithian Fold Theory results. It is not an independent proof. External curricula and production tools calibrate presentation only and never supply SFT authority.

Structural One

Claim: SFT-FOUNDATION-ONE-001 Receipt:

sha256: 68332624c276dc5d0ddfd568a26b95e20d7d5665fcdb7e825ff1b7b19bf1d51c

The admitted result establishes the exact self-whole within its formal boundary: complete coverage of the admitted occurrence, with no omission and no unforced extra. The complete Moon Lantern is the child-facing demonstration.

Exact positive finite count

Claim: SFT-FOUNDATION-COUNT-001 Receipt:

sha256: 4b2411716cbef2fb9fa7aac58b24ce5eb3c0c59fe7230fd703fd89b5260f6e23

The admitted result retains every generated occurrence once, adds none, and gives the complete positive finite trace. Count Keeper and Doorway Parade translate the skip/repeat/extra boundary into visible actions.

Exact positive part coordinate

Claim: SFT-FOUNDATION-PART-001 Receipt:

sha256: 87b40affae50458ba5492af91778fbca79a8de0bc3b951e520535093c2b7b728

Within one registered positive finite partition, the formal result requires complete coverage, disjoint parts, equal fibres and positive held/whole counts. The lantern activities hold one fixed four-part plan. They do not establish equivalence with a different partition.

Exact arithmetic and junction addition

Claims: SFT-MATH-EXACT-ARITHMETIC-001 and SFT-MATH-ARITH-JUNCTION-ADDITION-002 Receipts:

sha256: 28252bae62373d8657967ba28f8f2d497c2cf09abbae71609cb05c4f40196418 and

sha256: ecbb32a37fb10022315429bb39d88f49437fc856396d0b8db42fca49b2032493

The book uses conventional + and = only after the exact SFT structures are fixed. Addition joins two held-disjoint counted groups while every source part remains visible exactly once. Equality says both sides count the same exact four parts.

What this book does not claim

E02 does not derive or teach as SFT authority:

- numerical zero or an empty held selection;

- fractions, division, decimals or the claim that each part is a numerical quarter;
- negative, irrational, imaginary or floating proof quantities;
- completed infinity or an ungenerated continuum;
- equivalence between differently generated partitions; or
- the idea that four parts and one whole lantern are the same unit.

Why the repeated objects are emoji

The Moon Lantern, moon, sun, door, parcel and lantern quarters use stable, versioned OpenMoji assets. The four quarters are mechanical crops of the same OpenMoji lantern, not newly generated pictures. This keeps repeated items clear and recognisable from page to page. Generated illustrations supply setting, character, emotion and one-off story action only.

OpenMoji assets are used under CC BY-SA 4.0. The original story text is licensed CC BY 4.0.

Safe optional play away from the page

The book is complete without materials. If useful, an adult may prepare four large card pieces and a large matching frame. Avoid small loose parts, glass lanterns, hot lights and cutting tools within the child's reach. The child may watch, point or direct an adult rather than handle pieces.

Try these short extensions:

- Put four large cards in a row and touch each once while counting.
- Hide one card and ask which visible place is empty.
- Put two cards on one mat and two on another, then count them together.
- Rebuild the same four-place frame and check for a gap or overlap.

Keep the language tied to what is visible. Say “This place has no card in it” before using a more general word such as *empty*.

Accessibility

- Accept pointing, gaze, signing, speech, movement and communication aids.
- Describe each picture aloud when helpful.
- Use shape, position, outline, size and words; never colour alone.
- Offer enlarged pages or the semantic HTML edition for scalable text.
- Use tactile outlines or large pieces with different edge textures if helpful.
- Give unlimited thinking time and repeat an activity without penalty.
- Do not describe the PDF as fully tagged; use the semantic HTML for structured access.

Medium independence and continuity

This is a complete picture book. It does not require the companion game to explain its story, activities, answers or lesson. The game may adapt the same sequence with movement and replay, but it is not evidence for the book and cannot change the SFT boundary.

The ending closes the Moon Lantern problem. The moon–sun–moon pictures offer a gentle question for Book Three without teaching its answer. A child may stop here satisfied or continue in series order.

Publication boundary

This exact edition remains a review copy under edu. It must not be copied into publications/education until Maria Smith explicitly approves the final educational book.
