

Adult Guide — E02 One Whole, Many Parts

Review version 1.0.0 Author: Maria Smith Audience: parents, carers, early-years practitioners and teachers Final-publication status: awaiting Maria Smith's approval

Purpose

The child rejoins Mira, Sol and Tavi immediately after E01. The parcel already shown at the end of that book contains one Moon Lantern and a delivery card. The lantern is too wide for the workshop route, so the team must identify its whole, count a generated row without omission or duplication, choose a lawful visible partition, carry every registered piece, distinguish equal from unequal pieces, repair a gap, keep an extra outside and record both positive counts for a held part. The completed lantern then reaches the balcony and naturally begins the two-label pattern that previews E03.

This is one continuous caused story. Each challenge page pauses before its reveal. The reveal labels sit above a recognisable picture and name only what the child has just experienced.

The permanent cast and Pax

Mira, Sol and Tavi remain the main trio. E02 introduces exactly one new guest: Pax, the patient piece-keeper. Pax checks fitted trays and asks process questions but does not identify the correct layout or count before an attempt.

Pax may return in a later book only when components, partitions or reassembly are relevant. A later callback may ask whether every place is filled or whether pieces overlap; it must not reveal a new answer.

Narrative cause chain

1. The E01 parcel supplies the Moon Lantern and delivery card.
2. The narrow doorway creates a real need to inspect and later carry parts.
3. The Whole Seal opens the Count Bridge.
4. The complete count opens the Part Gate.
5. The accepted registered partition opens four Carry Slots.
6. Reassembly opens the Match Table.
7. Equal/unequal comparison opens the Gap and Extra Gates.
8. Correcting the gap and excluding the extra opens the Holding Dial.
9. Both positive counts release the final pieces.
10. Delayed recall checks the earlier counting lesson before delivery.

If the child loses the thread, say: “The lantern is too wide for this route. We are checking the whole and every part so we can rebuild it at the balcony.”

Experience-before-vocabulary

- whole — all of this registered thing, with none of it missing and nothing extra added;

- count — keep the complete generated row by visiting every item once, skipping none and repeating none;

- complete partition — all of the agreed whole is covered by its registered pieces;

- separate / non-overlapping — one piece does not sit over another piece;
- equal pieces — pieces made the same size in this particular partition;
- unequal pieces — visible pieces that are not the same size;
- held part — one or more chosen pieces contained in the complete

partition;

- held count — how many registered pieces are chosen; and
- whole count — how many registered pieces make the complete partition.

Do not introduce parameter-free coordinate, fibre, candidate grammar, multiplicity or depth-independent closure to the child. Those exact terms remain here to protect the source boundary.

Exact SFT source and dependency order

1. Structural One

Claim: SFT-FOUNDATION-ONE-001 Dependency: SFT-ROOT-THERE-IS-NO-NOTHING Status: independently replicated Provenance: forward forcing Closure: depth-independent Receipt: sha256:68332624c276dc5d0ddf568a26b95e20d7d5665fcdb7e825ff1b7b19bf1d51c

The unique minimal representation of the admitted root occurrence is its complete self-whole with no unforced addition; this structural identity is the One.

The complete generated product classifies root coverage as none, proper or complete, crossed with absence or presence of unforced extra material. Six forms are decided. Only exact-self-whole retains the complete admitted occurrence without omission or addition. Arithmetic and fractions are not imported into this claim.

2. Exact positive finite count

Claim: SFT-FOUNDATION-COUNT-001 Dependency: SFT-FOUNDATION-ONE-001 Status: independently replicated Provenance: forward forcing Closure: depth-independent across every generated nonempty finite extension Receipt: sha256:4b2411716cbef2fb9fa7aac58b24ce5eb3c0c59fe7230fd703fd89b5260f6e23

Every generated nonempty finite succession of structural-One occurrences has one exact positive count representation: its complete generation trace, retaining every generated occurrence once and adding none.

The grammar has ten representation classes across coverage, retained multiplicity and ungenerated extra occurrences. Only complete-coverage__once__no-extra survives. E02 translates omission, duplication and addition into a four-light bridge. The bridge is a demonstration, not the formal proof.

3. Exact positive part coordinate

Claim: SFT-FOUNDATION-PART-001 Dependency: SFT-FOUNDATION-COUNT-001 Status: independently replicated Provenance: forward forcing Closure: depth-independent within the registered positive finite partition boundary Receipt:

sha256:87b40affae50458ba5492af91778fbca79a8de0bc3b951e520535093c2b7b728

For every registered finite partition of the structural One that is complete,
disjoint and equal-fibred, and every nonempty held selection contained within
it, the unique parameter-free exact part coordinate is the pair of positive
counts identifying the held selection and the complete partition.

The formal grammar contains 192 generated alternatives. It classifies whole coverage, overlap, fibre equality, selection position, held-count presence, whole-count presence and extra coordinates. Exactly complete__disjoint__equal__within__held-present__whole-present__no-extra survives.

The non-negotiable boundary

E02 does not derive or teach as SFT authority:

- numerical zero or an empty held selection;
- negative, imaginary, irrational, decimal or floating proof quantity;
- completed infinity or an ungenerated continuum;
- division imported as a foundational operation;
- equivalence between differently generated partitions; or
- the claim that every object called “one piece” has equal size.

The child-facing label 2 HELD · 4 MAKE THE WHOLE keeps the exact positive pair. Do not silently replace it with a decimal. Do not claim it is interchangeable with 1 held · 2 make the whole; cross-partition equivalence belongs to the separate admitted downstream theorem and is deliberately postponed.

How to share each challenge/reveal pair

1. Read the challenge and pause.
2. Let the child look across every pictured alternative.
3. Accept pointing, gaze, sign, speech, movement or communication aids.
4. Ask one process question without naming the answer.
5. Turn to the reveal and compare the same objects in the same positions.
6. Keep a first attempt that differed; identify exactly what changed.
7. Replay with safe large objects if useful.

The reveal is a shared check, not a score screen.

Page guidance and answers

Pages 3-8 — parcel and Whole Seal

Pages 3-6 establish the previous-book callback, need and single new guest. Page 7 answer: the complete round lantern, not the lantern with a gap and not the complete lantern plus an attached extra. Page 8 introduces whole only after the child has compared all three.

Pages 9-13 — Count Bridge

Page 10 asks the child to visit the four visible tiles once each. Page 12 preserves Sol's route 1, 2, 3, 3, 4; the problem is the repeated third tile. Page 13 explicitly keeps that failed attempt and rebuilds the trace.

Pages 14-17 — Part Gate

The accepted layout is the one that fills the entire agreed outline, has no overlap and uses same-sized pieces. A layout can fail more than one condition. Ask all three questions rather than accepting a familiar-looking picture.

Pages 18-20 — carrying and reassembly

Every registered piece moves from a fitted tray into the one outline. The empty tray is checked after rebuilding. No new piece appears during the reveal.

Pages 21-22 — equal and unequal

Pair A is equal-sized; Pair B is visibly unequal. Unequal pieces are not called false or bad. The narrower claim is that counts alone cannot identify equal portions when the partition pieces are unequal.

Pages 23-25 — gap and extra

Page 23 is not complete because one registered place is unfilled. Page 24 returns the registered fourth piece. Page 25 keeps the extra triangle visible and outside; it does not disappear and is not absorbed into the lantern by a word.

Pages 26-27 — held and whole counts

Answer: two pieces are held and four pieces make the complete registered partition. Both positive counts stay visible. Do not extend the activity to an empty held selection in this book.

Pages 28-29 — delayed retrieval

Answer B: Sol touched one tile twice. If the child first chooses A or C, say, "Look for a tile with two footprints." Do not say "the answer is B" before a genuine reinspection.

Pages 30-32 — delivery, summary and next dependency

The registered lantern is rebuilt before delivery. Page 31 gives a three-part retrieval routine. Page 32 previews the two-label transition and recurrence of E03 without teaching its result or unlocking Level Three.

Safe optional materials

The book is complete without materials. Optional use may include large card circles cut by an adult, four large foam shapes, a fitted tray outline and four large floor markers. Avoid

small loose parts, sharp cutting tools in the child's reach, glass, hot lamps and flashing lights. The child may watch rather than handle pieces.

Accessibility

- Keep words and reveal labels above pictures.
- Read picture descriptions aloud when helpful.
- Use shape, position, outline and text; never colour alone.
- Offer tactile outlines and large pieces with distinct edge textures.
- Allow extra processing time and unlimited replay without penalty.
- Keep candidate positions stable between challenge and reveal.
- Use the semantic HTML edition for scalable text and structured headings.
- The PDF will contain selectable text but will not be called fully tagged

unless that is independently verified.

Companion Level Two requirements

Every paired stage must be directly playable by touch, keyboard and assistive technology and include a replay control. Mira, Sol and Tavi remain visible; Pax is the sole new Level Two guest. The book-page bridge remains available after a correct answer. Optional codes unlock only character moments, alternate replay arrangements or an E03 preview.

Narration must be caption-matched and pre-rendered from Maria Smith's local Kokoro weights. Audio and sound effects are delivery tools only. The installed game must run offline, collect no personal or behavioural data and keep optional progress locally on the device.

Reference-only curriculum navigation

The activities can support early communication, counting actions, shape comparison, spatial language, matching, fine-motor movement, recall and collaborative checking. UK early-years frameworks calibrate presentation only; they do not supply or validate any SFT premise.
